

ABSTRACT

of the graduation project

«Galvanic guild of apparatus-building factory. Development of technological process galvanic precipitation of tin on the printed circuit board assembly in automatic line»

finished by the student of Department of Electrochemical Plants Technology

Rak Olga S.

In the project the workflow galvanic deposition of tin coatings on conductive pattern of the printed circuit board assembly using sulfate electrolyte with additives such STH Zusatz and Suffotech SP is designed. This electrolyte is characterized by high scattering ability, uniform distribution of copper on the surface of the board, regardless of its size and picture conductors sedimentation of plastic, very strong layer with low internal tensions. For electroplating galvanic bath with a capacity of 86 000 units/year was selected and designed .

The project envisages measures for safety and automation of process parameters, guild, method of sewage treatment by reagent method proposed was propered designed the main technical and economic indicators was designed.

Keywords: printed circuit boards, tin coating application, sulfate electrolyte, metallorizist, conductive pattern, wastewater, automation of process parameters.
